

* Data Type

It is a type of data in which we are storing inside a variable in memory location.

[Data Type]

Single value
Data type

Multi value
or Data type

Number

Boolean

int float comple True False

- String 6 30 methods

- tuples 209 ()

- list 13

- Sets

- Dictionary 11

i) Single value data type :- (individual Data type primitive Data type)

A data type that stores only one value at time in a variable.

Types:-

i) Numeric data type :-

A data type used to store numbers (numeric values) in variable.

Types:-

a) Integer

b) Float

c) Complex

ii) Boolean Data Type :-

A data type that stores only two values True or False.

Individual data type

A value that is stored inside a single memory block is known as individual data type / single value data type.

a = 10

b = True

c = False

d = 5.6

e = 5 + 6j

Individual data type classification :-

1. Integer data type
2. Float data type
3. Complex data type
4. Boolean data type.

2) Multi Value Data Type :- (Collection D.T, Iterable, Predefined D.T, Non primitive D.T)

Here we can store more than or more values.

Types :-

1. String
2. List
3. Tuple
4. Set
5. Dictionary
